Second Look

Is the pill in your bottle the medicine on your label?

Photograph the label and one pill. AI reads what is visible; code compares it with real FDA records and shows the evidence.

Why take a second look?

Flynn et al. estimated **51.5 million US pharmacy dispensing errors a year** in 2003.[1] A refill's changed color was associated with **34% higher odds** of stopping heart medicine; changed shape, **66%.**[2] These are addressable problems, not errors this app has proven it prevents.

AI reads. Code decides.

Label photo → **Pill photo** → **AI reads** → **FDA records** → **Code decides**

Compare imprint, color and shape across manufacturers of the same medicine and strength. A second view can help. Size is reference only. When the evidence is unclear, say "can't tell".

Doesn't match

This imprint belongs to acetaminophen 500 mg. Don't take it. Call your pharmacy.

A result with a clear next step

FDA appearance, drawn from real fields

Real records, visible sources

FDA DailyMed: product label and publication date. **NLM RxNorm:** medicine, strength and other manufacturers. **NIH pill-image archive:** research photos. Every result links to its records. Demo patient labels are fictional.

A frozen test, not a safety claim

150 NIH photos · 75 new products · 300 label–photo pairs. On the frozen one-view test, Second Look passed **1/150 wrong pills**; direct AI passed 2/150. When it answered, it was correct **83/88** times versus 83/94. False alarms: **4 versus 9**. It could not tell on **212/300 pairs (70.6%)**; direct AI, 206/300 (68.6%). The coverage goal was not met.

We **found and fixed a safety bug**: a short, look-alike imprint could pass. Cached post-fix results are separate and post-hoc, not a fresh test. These public 2016-era photos, known label codes and correlated views are not clinical validation. Full protocol and results: getsecondlook.vercel.app/research.

Not medical advice. Does not establish authenticity or replace your pharmacist. For a mismatch or uncertainty, don't take the pill until you check with your pharmacist.
